

A revolutionary computer
deserves a revolutionary display.

Introducing the ultimate companion to the Power Mac G4: the Apple Cinema Display. Its 22-inch diagonal screen makes this the largest LCD display ever brought to market, with a viewing area identical to that of a 24-inch flat CRT display.

Its viewing quality, however, is a world apart: twice as bright and twice as sharp as a CRT, with triple the contrast ratio and absolutely zero flicker. And its colors remain true from almost any viewing angle.

Like a movie theatre, the Apple Cinema Display has a letterbox format (1600x1024 pixels), with room enough to display an entire 11x17 image. And unlike most other displays, it receives its data digitally from the computer, preserving the highest quality image.
